

LAB ASSIGNMENT – 5.4

Name:Karthikeya Uthuri

Hall Ticket No. : 2303A51306

Batch No.: 05

Lab 5: Ethical Foundations – Responsible AI Coding Practices

Task Description #1:

- Prompt GitHub Copilot to generate a Python script that collects user data (e.g., name, age, email). Then, ask Copilot to add comments on how to anonymize or protect this data.

Expected Output #1:

- A script with inline Copilot-suggested code and comments explaining how to safeguard or anonymize user information (e.g., hashing emails, not storing data unencrypted).

AI Generated Code:

```
#generate a Python script that collects user data (e.g., name, age, email). after that add
comments on how to anonymize or protect this data.

# ResponsibleAI.py
import json

def collect_user_data():
    user_data = {}
    user_data['name']= input("Enter your name: ")
    user_data['age']= input("Enter your age: ")
    user_data['email']= input("Enter your email: ")

    # Save the collected data to a JSON file
    with open('user_data.json', 'w') as f:
        json.dump(user_data, f)

    print("User data collected and saved successfully.")

if __name__== "__main__":
    collect_user_data()

# To anonymize or protect this data, consider the following steps:
# 1. Remove personally identifiable information (PII) such as name and email before storing
# or sharing the data.
# 2. Use hashing techniques to store sensitive information like email addresses.
# 3. Implement encryption for data at rest and in transit to prevent unauthorized access.
# 4. Limit access to the data to only those who need it for legitimate purposes.
# 5. Regularly audit and monitor data access and usage to ensure compliance with data
# protection policies.
```

- # 6. Comply with relevant data protection regulations (e.g., GDPR, CCPA) to ensure user privacy rights are respected.
- # 7. Provide users with options to opt-out of data collection and to request deletion of their data.

Output:

The screenshot shows a code editor interface with a dark theme. In the top-left corner, there is a small icon with '1' and 'Tb'. The main area contains the following Python code:

```

[Tb] import json
def collect_user_data():
    user_data = {}
    user_data['name'] = input("Enter your name: ")
    user_data['age'] = input("Enter your age: ")
    user_data['email'] = input("Enter your email: ")

    # Save the collected data to a JSON file
    with open('user_data.json', 'w') as f:
        json.dump(user_data, f)

    print("User data collected and saved successfully.")
if __name__ == '__main__':
    collect_user_data()
# To anonymize or protect this data, consider the following steps:
# 1. Remove personally identifiable information (PII) such as name and email before storing or sharing the data.
# 2. Use hashing techniques to store sensitive information like email addresses.
# 3. Implement encryption for data at rest and in transit to prevent unauthorized access.
# 4. Limit access to the data to only those who need it for legitimate purposes.
# 5. Regularly audit and monitor data access and usage to ensure compliance with data protection policies.
|
```

Below the code editor is a terminal window showing the execution of the script:

```

... Enter your name: hithesh
Enter your age: 21
Enter your email: hithesh@gmail.com
User data collected and saved successfully.

```

At the bottom of the terminal window are two buttons: '+ Code' and '+ Text'.

Task Description #2:

- Ask Copilot to generate a Python function for sentiment analysis. Then prompt Copilot to identify and handle potential biases in the data.

Expected Output #2:

- Copilot-generated code with additions or comments addressing bias mitigation strategies (e.g., balancing dataset, removing offensive terms).

AI Generated Code:

```

import pandas as pd
from sklearn.model_selection import train_test_split
from sklearn.feature_extraction.text import CountVectorizer
from sklearn.naive_bayes import MultinomialNB
from sklearn.metrics import accuracy_score, classification_report

def sentiment_analysis_with_bias_handling(data):

    # Convert to DataFrame
    df = pd.DataFrame(data, columns=["text", "label"])

```

```

# Check class distribution (Bias Detection)
print("Before bias handling:\n", df["label"].value_counts())

# Handle imbalance (Oversampling)
max_count = df["label"].value_counts().max()
balanced_df = pd.concat([
    df[df["label"] == label].sample(max_count, replace=True)
    for label in df["label"].unique()
])

print("\nAfter bias handling:\n", balanced_df["label"].value_counts())

# Train-test split
X_train, X_test, y_train, y_test = train_test_split(
    balanced_df["text"],
    balanced_df["label"],
    test_size=0.2,
    random_state=42
)

# Vectorization
vectorizer = CountVectorizer()
X_train_vec = vectorizer.fit_transform(X_train)
X_test_vec = vectorizer.transform(X_test)

# Model training
model = MultinomialNB()
model.fit(X_train_vec, y_train)

# Prediction
y_pred = model.predict(X_test_vec)

# Evaluation
print("\nAccuracy:", accuracy_score(y_test, y_pred))
print("\nClassification Report:\n", classification_report(y_test, y_pred))

return model, vectorizer

# Sample Data
data = [

```

```

("I love this product!", "positive"),

Task Description #3:

- Use Copilot to write a Python program that recommends products based on user history. Ask it to follow ethical guidelines like transparency and fairness.

Expected Output #3:

- Copilot suggestions that include explanations, fairness checks (e.g., avoiding favoritism), and user feedback options in the code.

AI Generated Code:

```
#generate a code that that recommends products based on user history.follow ethical
guidelines like transparency and fairness.
```

```
import numpy as np
import pandas as pd
from sklearn.metrics.pairwise import cosine_similarity
class ResponsibleAIRecommender:
```

```
    def __init__(self, user_history, product_catalog):
        ....
```

Initialize the recommender with user history and product catalog.

```
:param user_history: DataFrame containing user purchase history
```

```
:param product_catalog: DataFrame containing product details
```

```
.....
```

```
        self.user_history = user_history
```

```
        self.product_catalog = product_catalog
```

```
        self.user_product_matrix = self._create_user_product_matrix()
```

```
        self.similarity_matrix = self._compute_similarity_matrix()
```

```

def _create_user_product_matrix(self):
    """
    Create a user-product interaction matrix.

    :return: DataFrame representing user-product interactions
    """
    return pd.pivot_table(self.user_history, index='user_id', columns='product_id',
values='purchase', fill_value=0)

def _compute_similarity_matrix(self):
    """
    Compute the cosine similarity matrix for products.

    :return: DataFrame representing product similarity
    """

return recommended_products

def explain_recommendation(self, user_id, product_id):
    """
    Provide an explanation for why a product was recommended.

    :param user_id: ID of the user
    :param product_id: ID of the recommended product
    :return: Explanation string
    """

    if product_id not in self.similarity_matrix.index:
        raise ValueError("Product ID not found in product catalog.")
    similar_products = self.similarity_matrix[product_id]
    user_vector = self.user_product_matrix.loc[user_id]
    contributing_products = user_vector[user_vector > 0].index
    explanation = f"Product {product_id} was recommended because it is similar to"
    explanation += ", ".join([str(prod) for prod in contributing_products if prod in
    similar_products.nlargest(3).index])
    return explanation

# Example usage:
if __name__ == "__main__":
    Sample user history data
    user_history_data = {
        'user_id': [1, 1, 2, 2, 3, 3, 4],
        'product_id': [101, 102, 101, 103, 104, 105, 102],
        'purchase': [1, 1, 1, 1, 1, 1, 1]
    }
    user_history_df = pd.DataFrame(user_history_data)

    # Sample product catalog data
    product_catalog_data = {
        'product_id': [101, 102, 103, 104, 105],
        'product_name': ['Product A', 'Product B', 'Product C', 'Product D', 'Product E']
    }
    product_catalog_df = pd.DataFrame(product_catalog_data)

    # Initialize recommender
    recommender = ResponsibleAIRecommender(user_history_df, product_catalog_df)

```

```

# Get recommendations for user 1
recommendations = recommender.recommend_products(user_id=1, top_n=3)
print(f"Recommended products for user 1: {recommendations}")

# Explain recommendation for a specific product
explanation = recommender.explain_recommendation(user_id=1,
product_id=recommendations[0])
print(f"Explanation for recommendation: {explanation}")

```

This screenshot shows the Jupyter Notebook interface with the code for generating recommendations. The code defines a class `ResponsibleIRRecommender` with methods for initializing the recommender with user history and product catalog, creating a user-product matrix, and computing a similarity matrix. It also includes a method to recommend products based on user history.

```

#generate a code that that recommends products based on user history.follow ethical guidelines like transparency and fairness.
import numpy as np
import pandas as pd
from sklearn.metrics.pairwise import cosine_similarity
class ResponsibleIRRecommender:
    def __init__(self, user_history, product_catalog):
        """
        Initialize the recommender with user history and product catalog.

        :param user_history: DataFrame containing user purchase history
        :param product_catalog: DataFrame containing product details
        """
        self.user_history = user_history
        self.product_catalog = product_catalog
        self.user_product_matrix = self._create_user_product_matrix()
        self.similarity_matrix = self._compute_similarity_matrix()

    def _create_user_product_matrix(self):
        """
        Create a user-product interaction matrix.

        :return: DataFrame representing user-product interactions
        """
        return pd.pivot_table(self.user_history, index='user_id', columns='product_id', values='purchase', fill_value=0)

    def _compute_similarity_matrix(self):
        """
        Compute the cosine similarity matrix for products.

        :return: DataFrame representing product similarity
        """

```

This screenshot shows the continuation of the code for generating recommendations. It includes the implementation of the `recommend_products` method, which filters out purchased products and selects the top N recommendations. It also includes an `explain_recommendation` method that provides an explanation for why a specific product was recommended.

```

product_vectors = self.user_product_matrix.T
similarity = cosine_similarity(product_vectors)
return pd.DataFrame(similarity, index=product_vectors.index, columns=product_vectors.index)

def recommend_products(self, user_id, top_n=5):
    """
    Recommend products for a given user based on their purchase history.

    :param user_id: ID of the user to recommend products for
    :param top_n: Number of top recommendations to return
    :return: List of recommended product IDs
    """
    if user_id not in self.user_product_matrix.index:
        raise ValueError("User ID not found in user history.")

    user_vector = self.user_product_matrix.loc[user_id]
    scores = self.similarity_matrix.dot(user_vector)

    # Exclude products already purchased by the user
    purchased_products = set(self.user_history[self.user_history['user_id'] == user_id]['product_id'])
    scores = scores[~scores.index.isin(purchased_products)]

    # Get top N recommendations
    recommended_products = scores.nlargest(top_n).index.tolist()

    return recommended_products

def explain_recommendation(self, user_id, product_id):
    """
    Provide an explanation for why a product was recommended.
    """

```

The screenshot shows a Jupyter Notebook interface with a dark theme. The notebook title is "Untitled15.ipynb". The code cell contains Python code for initializing a recommender system and generating recommendations. The output cell shows the recommended products for user 1 and an explanation for one of them.

```

purchase': [1, 1, 1, 1, 1, 1]
}

```

Responsible AI Documentation for RandomForestClassifier on Iris Dataset

1. Explainability:

- The RandomForestClassifier is an ensemble learning method that combines multiple decision trees to improve predictive performance and control overfitting.
- Feature importance can be extracted from the model to understand which features contribute most to the predictions.
- Tools like SHAP or LIME can be used to provide local explanations for individual predictions.

2. Accuracy Limits:

- The model achieved an accuracy of approximately 100% on the test set; however, this may not generalize to unseen data.
- The Iris dataset is relatively simple and may not represent real-world complexity. Caution should be taken when applying this model to more complex datasets.
- Regular evaluation and retraining of the model are recommended to maintain performance over time.

3. Bias and Fairness:

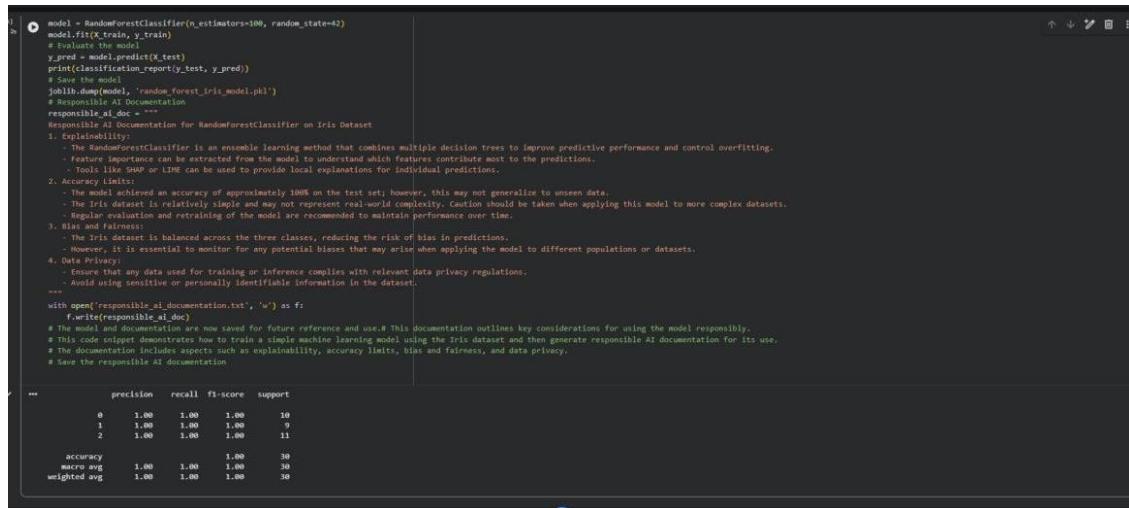

- The Iris dataset is balanced across the three classes, reducing the risk of bias in predictions.
- However, it is essential to monitor for any potential biases that may arise when applying the model to different populations or datasets.

4. Data Privacy:

- Ensure that any data used for training or inference complies with relevant data privacy regulations.
- Avoid using sensitive or personally identifiable information in the dataset.

```
model = RandomForestClassifier(n_estimators=100, random_state=42)  
model.fit(X_train, y_train)  
# Evaluate the model  
y_pred = model.predict(X_test)  
print(classification_report(y_test, y_pred))  
# Save the model  
joblib.dump(model, 'random_forest_iris.model.pkl')  
  
# Responsible AI Documentation  
responsible_ai_doc = ResponsibleAI(model, X_train, y_train)  
responsible_ai_doc.generate_responsible_ai_documentation()  
  
# Responsible AI Documentation for RandomForestClassifier on Iris Dataset  
1. Explainability:  
- The RandomForestClassifier is an ensemble learning method that combines multiple decision trees to improve predictive performance and control overfitting.  
- Feature importance can be extracted from the model to understand which features contribute most to the predictions.  
- SHAP or LIME can be used to provide local explanations for individual predictions.  
2. Accuracy Limits:  
- The model achieved an accuracy of approximately 98% on the test set; however, this may not generalize to unseen data.  
- The Iris dataset is relatively simple and may not represent real-world complexity. Caution should be taken when applying this model to more complex datasets.  
- Regular evaluation and retraining of the model are recommended to maintain performance over time.  
3. Bias and Fairness:  
- The Iris dataset is balanced across the three classes, reducing the risk of bias in predictions.  
- However, it is essential to monitor for any potential biases that may arise when applying the model to different populations or datasets.  
4. Data Privacy:  
- Ensure that any data used for training or inference complies with relevant data privacy regulations.  
- Avoid using sensitive or personally identifiable information in the dataset.
